Azure Services Architecture

Which Azure service processes which input, and how results reach the kiosk

Document Intelligence reads the ID and boarding pass. Video Indexer finds the faces in the identity video, and their thumbnails train a Face person group that is matched against the ID face. Custom Vision scores the luggage images for lighters. The Python kiosk application looks the passenger up by ticket number, runs the five validations, shows the message and writes the result to Blob Storage. Dashed lines are storage traffic: training data for the custom models, and results written back.
